

LP-I problem Statement

1. Design suitable Data structures and implement Pass-I of a two-pass assembler pseudo-machine. (The output of Pass-I (intermediate code file and symbol table, literal table).
2. Design suitable Data structures and implement Pass-II of a two-pass assembler for pseudo-machine. Implementation should consist of a few instructions from each category and few assembler directives. The output of Pass-I (intermediate code file and symbol table) should be input for Pass-II.
3. Write a program to create Dynamic Link Library for any mathematical operation and write an application program to test it. (Use VB).
4. Write a program to simulate CPU Scheduling Algorithms: (Non-Preemptive (FCFS), Round Robin, SJF, Priority)
5. Write a program to simulate Page replacement algorithm. (Optimal page replacement, FIFO, LRU).
6. Understanding the connectivity of Raspberry-Pi / Arduino with IR sensor. Write an application to detect obstacle and notify user using LEDs.
7. Understanding the connectivity of Arduino circuit with temperature sensor display temperature and humidity. Write an application to read the environment temperature.
8. Understanding the connectivity of Arduino circuit with Ultrasonic Sensor/LM35 Sensor sensor/temperature sensor/ DHT 11 sensor etc... display temperature and humidity. Write an application to read the environment temperature.
9. Install Raspberry pi OS and perform connectivity of Raspberry pi with ultrasonic sensor.

NOTE:

IOT: Arduino circuit with LM35/ DHT11/ ultrasonic /Temperature sensor to display object /temperature/ obstacle

Raspberry Pi with ultrasonic sensor....

SPOS:

All Practical Index of SPOS i.e. Pass I and Pass II Assembler, Pass I/II Macroprocess, CPU Scheduling (all Algorithm), Page replacement (all Algorithm)

Prepare as per the LP-I Index
